How to scan the home for Airbnb's 3D floor plan

Thank you for the work you put into every turnover. A clean, well-set-up home is a big part of why guests book and why they leave good reviews, and that comes from you.

Airbnb now shows guests a 3D floor plan of the home, built from a scan in the Airbnb app. You see the place at its best, right after a clean, so you're the right person to scan it.

What the finished floor plan looks like in the Airbnb app.

What you need

An iPhone Pro (12 or newer) or an iPad Pro (2020 or newer). Regular iPhones and Android phones can't do this scan, because it uses a depth sensor only the Pro models have.

The Airbnb app, signed in with the co-host access your host set up for you.

Before you scan

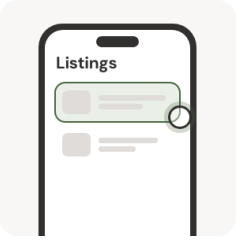

Finish the full clean and staging first. The scan picks up furniture and objects, so whatever is in the room ends up on the floor plan.

Open every shower curtain. Airbnb says showers don't scan properly with the curtain closed.

Put away your cart, bags, cleaning supplies, and any owner items or mail. Nothing personal should be in the scan.

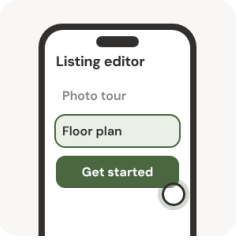

Turn on the lights and open the doors between rooms.

Step by step

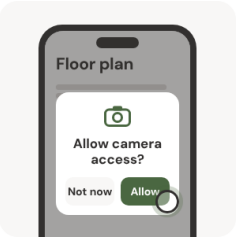

1

Open the listing. In the Airbnb app, tap **Listings** and pick the home you're in.

2

Start the floor plan. Under **Listing editor**, tap **Floor plan**, then **Get started**.

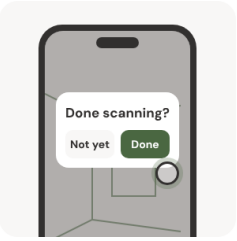

3

Allow the camera. Tap allow when the app asks for camera access, then read the short tip sheet it shows you.

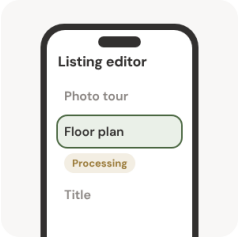

4

Walk through every room. Move slowly and point the camera at the walls, floor, and furniture in each room. Include bedrooms, bathrooms, the kitchen, and living areas. Don't skip a room, even a small one.

5

Submit the scan. Tap **Done**, then confirm **Done scanning?**

6

Check it says Processing. Back under **Floor plan** in the listing editor, you should see **Processing**. That means it went through.

7

Let your host know. Send them a quick message with the date you scanned the home.

What happens next

Airbnb takes 24 to 48 hours to build the floor plan, and your host reviews it before guests see it. If the scan stops partway or something looks off, scan again on your next turnover.
